Python Programming Fundamentals Cheat Sheet

| Package/Method | Description | Syntax and Code Example |
|------------------|-----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AND | Returns `True` if both statement1 and statement2 are `True`. Otherwise, returns `False`. | <pre>Example: marks = 90 attendance_percentage = 87 if marks >= 80 and attendance_percentage >= 85: print("qualify for honors") else: print("Not qualified for honors") # Output = qualify for honors</pre> |
| Class Definition | Defines a blueprint for creating objects and defining their attributes and behaviors. | <pre>Syntax: class ClassName: # Class attributes and methods Example: class Person: definit(self, name, age): self.name = name self.age = age</pre> |
| Define Function | A `function` is a reusable block of code that performs a specific task or set of tasks when called. | Syntax: def function_name(parameters): # Function body Example: def greet(name): print("Hello,", name) |

about:blank 1/10

| 1 | İ | |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| | | |
| | | |
| | | |
| | | Syntax: |
| | | variable1 == variable2 |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | Example 1: |
| | | 5 == 5 |
| | | |
| | | |
| Equal(==) | Checks if two values are equal. | |
| | | |
| | | returns True |
| | | Example 2: |
| | | age = 25 age == 30 |
| | | age == 30 |
| | | |
| | | |
| | | |
| | | |
| | | returns False |
| For Loop | A `for` loop repeatedly executes a block of code for a | Syntax: |
| | A `for` loop repeatedly executes a block of code for a specified number of iterations or over a sequence of elements (list, range, string, etc.). | for variable in sequence: # Code to repeat |
| | | |
| | | |
| | | |
| | | |
| | | F 14 |
| | | Example 1: |
| | | for num in range(1, 10): print(num) |
| | | |
| | | |
| | | |
| | | |
| | | Example 2: |
| | | |
| | | <pre>fruits = ["apple", "banana", "orange", "grape", "kiwi"] for fruit in fruits: print(fruit)</pre> |
| | | |

|------------------------------|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | |
| Function Call | A function call is the act of executing the code within the function using the provided arguments. | Syntax: function_name(arguments) Example: greet("Alice") |
| Greater Than or Equal To(>=) | Checks if the value of variable1 is greater than or equal to variable2. | <pre>Syntax: variable1 >= variable2 Example 1: 5 >= 5 and 9 >= 5 returns True Example 2: quantity = 105 minimum = 100 quantity >= minimum</pre> |
| Greater Than(>) | Checks if the value of variable1 is greater than variable2. | returns True Syntax: variable1 > variable2 |

9/3/25, 7:34 PM

| 9/3/25, / | :34 PIVI | | about:blank |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | | Example 1: 9 > 6 returns True Example 2: age = 20 max_age = 25 age > max_age |
| | | | returns False |
| | | | Syntax: if condition: #code block for if statement |
| If State | ement | Executes code block `if` the condition is `True`. | <pre>Example: if temperature > 30: print("It's a hot day!")</pre> |
| If-Elif | -Else | Executes the first code block if condition1 is `True`, otherwise checks condition2, and so on. If no condition is `True`, the else block is executed. | Syntax: if condition1: # Code if condition1 is True elif condition2: # Code if condition2 is True else: # Code if no condition is True |
| | | | <pre>Example: score = 85 # Example score if score >= 90: print("You got an A!") elif score >= 80: print("You got a B.") else: print("You need to work harder.") # Output = You got a B.</pre> |

| If-Else Statement | Executes the first code block if the condition is `True`, otherwise the second block. | <pre>Syntax: if condition: # Code, if condition is True else: # Code, if condition is False Example: if age >= 18: print("You're an adult.") else: print("You're not an adult yet.")</pre> |
|------------------------------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Less Than or Equal To(<=) | Checks if the value of variable1 is less than or equal to variable2. | Example 1: 5 <= 5 and 3 <= 5 returns True Example 2: size = 38 max_size = 40 size <= max_size |

about:blank 5/10

9/3/25, 7:34 PM about:blank

```
Syntax:
                                                                                                                variable1 < variable2</pre>
                                                                                                        Example 1:
                                                                                                               4 < 6
Less Than(<)
                             Checks if the value of variable1 is less than variable2.
                                                                                                        returns True
                                                                                                        Example 2:
                                                                                                               score = 60
passing_score = 65
score < passing_score</pre>
                                                                                                        returns True
Loop Controls
                              `break` exits the loop prematurely. `continue` skips the rest
                                                                                                        Syntax:
                             of the current iteration and moves to the next iteration.
                                                                                                               for: # Code to repeat
if # boolean statement
break
                                                                                                                for: # Code to repeat
if # boolean statement
                                                                                                                           continue
                                                                                                        Example 1:
                                                                                                                for num in range(1, 6):
                                                                                                                     if num == 3:
    break
print(num)
                                                                                                        Example 2:
                                                                                                                for num in range(1, 6):
    if num == 3:
        continue
                                                                                                                     print(num)
```

about:blank 6/10

|------------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| | | |
| NOT | Returns `True` if variable is `False`, and vice versa. | Syntax: not variable Example: isLocked = False print(not isLocked) |
| Not Equal(!=) | Checks if two values are not equal. | returns True if the variable is False (i.e., unlocked). Syntax: variable1 != variable2 Example: a = 10 b = 20 a != b |
| | | returns True Example 2: count=0 count != 0 returns False |

about:blank 7/10

9/3/25, 7:34 PM about:blank

```
Syntax:
                                                                                                                object_name = ClassName(arguments)
                             Creates an instance of a class (object) using the class
Object Creation
                             constructor.
                                                                                                        Example:
                                                                                                                person1 = Person("Alice", 25)
                                                                                                        Syntax:
                                                                                                                statement1 or statement2
                                                                                                        Example:
                             Returns `True` if either statement1 or statement2 (or both)
                                                                                                                "Farewell Party Invitation"
OR
                                                                                                                grade = 12
if grade == 11 or grade == 12:
    print("Farewell Party Invitation")
                             are 'True'. Otherwise, returns 'False'.
                                                                                                                else:
                                                                                                                     print("Not eligible")
                                                                                                        returns True
range()
                             Generates a sequence of numbers within a specified range.
                                                                                                        Syntax:
                                                                                                                range(stop)
range(start, stop)
range(start, stop, step)
                                                                                                        Example:
                                                                                                                range(5) #generates a sequence of integers from 0 to 4. range(2, 10) #generates a sequence of integers from 2 to 9. range(1, 11, 2) #generates odd integers from 1 to 9.
```

| 1 | İ | 1 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | |
| Return Statement | `Return` is a keyword used to send a value back from a function to its caller. | <pre>Syntax: return value Example: def add(a, b): return a + b result = add(3, 5)</pre> |
| Try-Except Block | Tries to execute the code in the try block. If an exception of the specified type occurs, the code in the except block is executed. | <pre>Syntax: try: # Code that might raise an exception except ExceptionType: # Code to handle the exception Example: try: num = int(input("Enter a number: ")) except ValueError: print("Invalid input. Please enter a valid number.")</pre> |
| Try-Except with Else Block | Code in the 'else' block is executed if no exception occurs in the try block. | <pre>Syntax: try: # Code that might raise an exception except ExceptionType: # Code to handle the exception else: # Code to execute if no exception occurs Example: try: num = int(input("Enter a number: ")) except ValueError: print("Invalid input. Please enter a valid number") else: print("You entered:", num)</pre> |

| 9/3/25, 7:34 PM | | | about:blank | |
|-----------------|----------------------------------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| | | | | |
| | Try-Except with Finally Block | Code in the `finally` block always executes, regardless of whether an exception occurred. | <pre>Example: try: # Code that might raise an exception except ExceptionType: # Code to handle the exception finally: # Code that always executes Example: try: file = open("data.txt", "r") data = file.read() except FileNotFoundError: print("File not found.") finally: file.close()</pre> | |
| | While Loop | A `while` loop repeatedly executes a block of code as long as a specified condition remains `True`. | <pre>Syntax: while condition: # Code to repeat Example: count = 0 while count < 5: print(count) count += 1</pre> | |
