## Working with Data in Python Cheat Sheet

Reading and writing files

Package/Method	Description	Syntax and Code Example		
File opening modes	Different modes to open files for specific operations.	Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text)  Examples: with open("data.txt", "r") as file: content = file.read() print(content) with open("output.txt", "r")		
File reading methods	Different methods to read file content in various ways.	<pre>Syntax:     file.readlines() # reads all lines as a list     readline() # reads the next line as a string     file.read() # reads the entire file content as a string  Example:     with open("data.txt", "r") as file:         lines = file.readlines()         next_line = file.readline()         content = file.read()</pre>		
File writing methods	Different write methods to write content to a file.	<pre>Syntax:     file.write(content) # writes a string to the file     file.writelines(lines) # writes a list of strings to the file  Example:     lines = ["Hello\n", "World\n"]     with open("output.txt", "w") as file:         file.writelines(lines)</pre>		
Iterating over lines	Iterates through each line in the file	Syntax:  for line in file: # Code to process each line

Symtax:	9/5/25, 12:05 AM about:blank			about:blank
Open() and close()  Opens a file, performs operations, and explicitly closes the file using it close() method.  Syntax:  with open()  Opens a file = open(filename, mode) # Code that uses the file file file.close()  Example: file = open("data.txt", "r") content = file.read() file.close()  Syntax:  with open()  Opens a file using a with block, block, emsuring automatic  Example: Example:			using a 'loop'.	
with open(filename, mode) as file: # Code that uses the file  Opens a file using a with block, ensuring automatic  Example:		Open() and close()	file, performs operations, and explicitly closes the file using the close()	<pre>file = open(filename, mode) # Code that uses the file file.close()</pre> Example:
with open(filename, mode) as file: # Code that uses the file  Opens a file using a with block, ensuring automatic  Example:		with open(filename, mode) as file: # Code that uses the file  Example:		

## Pandas

Package/Meth	d Description	Syntax and Code Example
.read_csv()	Reads data from a `.CSV` file and creates a DataFrame.	Syntax: dataframe_name = pd.read_csv("filename.csv") Example: df = pd.read_csv("data.csv")

about:blank 2/9

9/5/25, 12:05 AM about:blank

9/3/23, 12.03 AIVI		about.blank
.read_excel()	Reads data from an Excel file and creates a DataFrame.	Syntax:  dataframe_name = pd.read_excel("filename.xlsx")  Example:  df = pd.read_excel("data.xlsx")
.to_csv()	Writes DataFrame to a CSV file.	Syntax:  dataframe_name.to_csv("output.csv", index=False)  Example:  df.to_csv("output.csv", index=False)
Access Columns	Accesses a specific column using [] in the DataFrame.	Syntax:  dataframe_name["column_name"] # Accesses single column dataframe_name[["column1", "column2"]] # Accesses multiple columns  Example:  df["age"] df[["name", "age"]]
describe()	Generates statistics summary of numeric columns in the DataFrame.	Syntax:  dataframe_name.describe()

about:blank 3/9

	<pre>Example:     df.describe()</pre>
Removes specified rows or columns from the DataFrame. axis=1 indicates columns. axis=0 indicates rows.	Syntax:  dataframe_name.drop(["column1", "column2"], axis=1, inplace=True) dataframe_name.drop(index=[row1, row2], axis=0, inplace=True)  Example:  df.drop(["age", "salary"], axis=1, inplace=True) # Will drop columns df.drop(index=[5, 10], axis=0, inplace=True) # Will drop rows
	Syntax:  dataframe_name.dropna(axis=0, inplace=True)
Removes rows with missing NaN values from the DataFrame. axis=0 indicates rows.	Example:  df.dropna(axis=θ, inplace=True)
Duplicate or repetitive values or records within a data set.	Syntax:  dataframe_name.duplicated()
	DataFrame. axis=1 indicates columns. axis=0 indicates rows.  Removes rows with missing NaN values from the DataFrame. axis=0 indicates rows.  Duplicate or repetitive values or records within a

5,25, 12,05,1111	1	a sead side in the sead of the
		<pre>Example:     duplicate_rows = df[df.duplicated()]</pre>
Filter Rows	Creates a new DataFrame with rows that meet specified conditions.	<pre>Syntax:     filtered_df = dataframe_name[(Conditional_statements)]  Example:     filtered_df = df[(df["age"] &gt; 30) &amp; (df["salary"] &lt; 50000)</pre>
grouphy()	Splits a DataFrame into groups based on specified criteria, enabling subsequent	Syntax:  grouped = dataframe_name.groupby(by, axis=0, level=None, as_index=True, sort=True, group_keys=True, squeeze=False, observed=False, dropna=True)
groupby() head()	aggregation, transformation, or analysis within each group.  Displays the first n rows of the DataFrame.	<pre>Example:     grouped = df.groupby(["category", "region"]).agg({"sales": "sum"})  Syntax:     dataframe_name.head(n)</pre>
		ua ta i i aine_niaine . nieau (ii)

// 3/23, 12.03 AW	I	Example:
		df.head(5)
		ui.lieau(5)
		Syntax:
		import pandas as pd
Import pandas	Imports the Pandas library with the alias pd.	
		Example:
		import pandas as pd
		Syntax:
		dataframe_name.info()
		data i i alie_nalie. i i i o ( )
:	Provides information about the DataFrame,	
info()	including data types and memory usage.	Example:
		df.info()
merge()	Merges two DataFrames based on multiple common columns.	Syntax:
		<pre>merged_df = pd.merge(df1, df2, on=["column1", "column2"])</pre>
		Example:
		<pre>merged_df = pd.merge(sales, products, on=["product_id", "category_id"])</pre>
1	1	ı

about:blank

1	İ	1
print DataFrame	Displays the content of the DataFrame.	<pre>Syntax:     print(df) # or just type df  Example:     print(df)     df</pre>
replace()	Replaces specific values in a column with new values.	Syntax:  dataframe_name["column_name"].replace(old_value, new_value, inplace=True)  Example:  df["status"].replace("In Progress", "Active", inplace=True)
tail()	Displays the last n rows of the DataFrame.	Syntax:  dataframe_name.tail(n)  Example:  df.tail(5)
ı about:blank	1	7

Numpy				
Package/Method	Description	Syntax and Code Example		
Importing NumPy	Imports the NumPy library.	Syntax:    import numpy as np  Example:    import numpy as np		
np.array()	Creates a one or multi-dimensional array,	<pre>Syntax:     array_1d = np.array([list1 values]) # 1D Array     array_2d = np.array([[list1 values], [list2 values]]) # 2D Array  Example:     array_1d = np.array([1, 2, 3]) # 1D Array     array_2d = np.array([[1, 2], [3, 4]]) # 2D Array</pre>		
Numpy Array Attributes	- Calculates the mean of array elements - Calculates the sum of array elements - Finds the minimum value in the array - Finds the maximum value in the array - Computes dot product of two arrays	Example:  np.mean(array) np.sum(array) np.min(array np.max(array) np.dot(array_1, array_2)
